KNOWLEDGESM

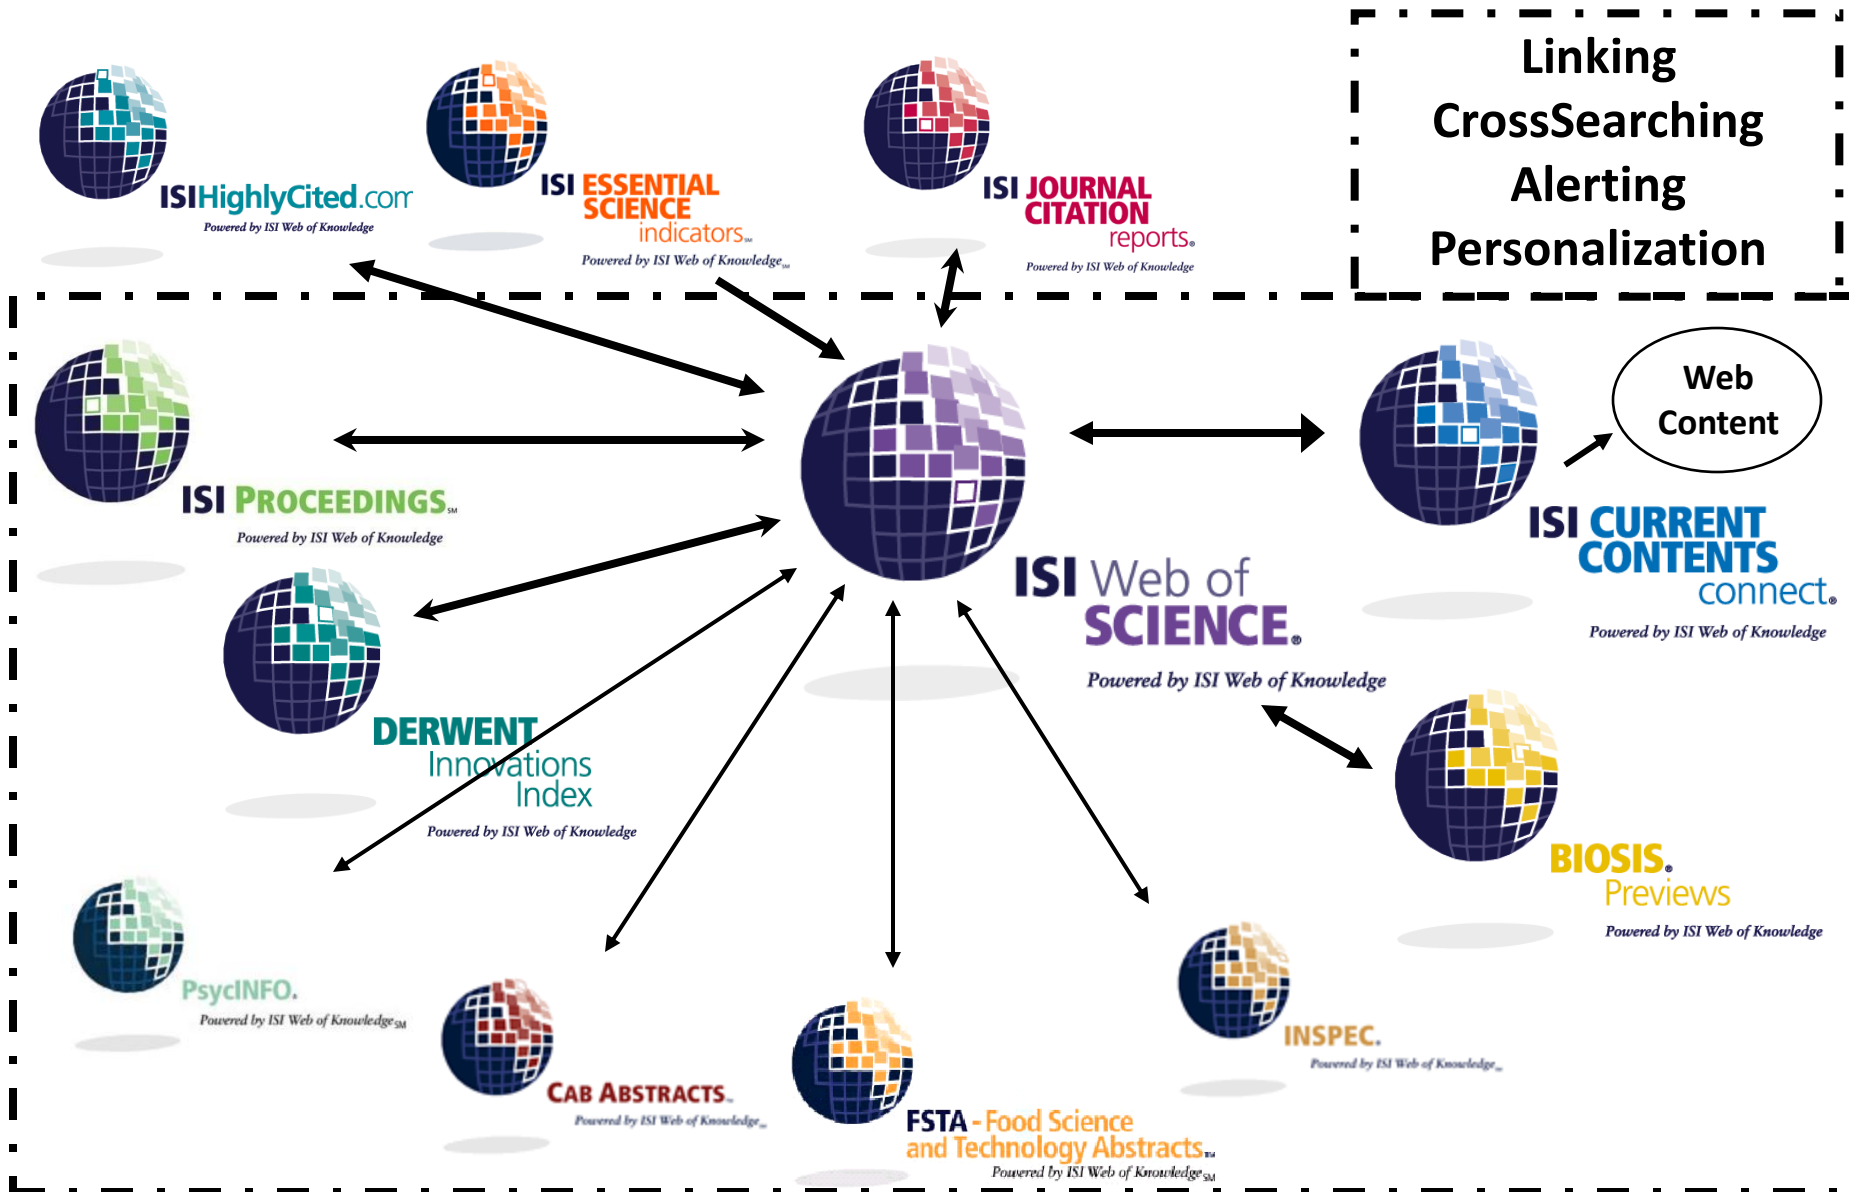

Transforming Research

The New Face of Research

Take the next step 

... the ISI Web of KNOWLEDGE

پیشینه

- موسسه اطلاعات علمی آمریکا (ISI) در دهه ۱۹۵۰ توسط یوجین گارفیلد پایه گذاری شد و فکر تدوین يك نمایه نامه استنادي از سال ۱۹۵۵ توسط وي مطرح شد
- هدف از تاسیس این موسسه و تهیه نمایه نامه استنادي , کمک به بازیابی اطلاعات چاپ شده علمی با استفاده از روش استنادي است.

چرا نمایه نامه استنادی علوم؟

- مرسوم است که پژوهشگران در نوشته های علمی و تحقیقاتی خویش به آثاری استناد کنند که در ارتباط با موضوع آنها نوشته شده و از این آثار در تایید نظرات خویش استفاده کنند یا تعارضات آنها را با اندیشه های علمی روز یا یافته های جدید نشان دهند
- به این نوشته ها که مورد استفاده پژوهشگر قرار گرفته ، اثر استناد شده **cited item** و نوشته خود پژوهشگر که به آن اثر استناد نموده ، اثر استناد کننده **citing item** نامیده می شود
- چنانچه مشخصات آثار استناد شده و مقاله های استناد کننده به آنها در یک مجموعه جمع شوند ، نمایه استنادی بوجود می آید که نمایه استنادی علوم SCI یا web of science نمونه بارز و جامع آن است •

اهداف و کاربردها

- یک مقاله توسط چه کسانی و در کدام منابع مورد استناد قرار گرفته است ؟
- یک اثر تحقیقی یا یک روش علمی مورد استفاده یا انتقاد دیگران قرار گرفته است ؟
- چه کسانی بر روی یک موضوع خاص مشغول تحقیق هستند ؟
- آیا موضوع یا روش خاصی هنوز مورد پژوهش یا کاربرد پژوهشگران جهان است ؟
- چه زمینه های موضوعی در هر سال بیشتر مورد توجه بوده است ؟
- میزان اطلاعات علمی منتشر شده در یک کشور خاص چگونه است ؟
- ارزش جهانی مقالات یک پژوهشگر از نظر کیفی چگونه است ؟ (اچ ایندکس)

کاربردهای web of science در محیط وب:

- جستجوی مآخذ و استنادها
- جستجوی نویسندگان و پژوهشگران
- جستجوی سازمان های علمی و پژوهشی
- تنظیم نتایج بر اساس تعداد دفعات استناد
- گزارش های تحلیلی استنادی (اچ ایندکس)

Abstract: Background and Methods. Maternal-infant transmission is the primary means by which young children become infected with human immunodeficiency virus type 1 (HIV). We conducted a randomized, double-blind, placebo-controlled trial of the efficacy and safety of zidovudine in reducing the risk of maternal-infant HIV transmission. HIV-infected pregnant women (14 to 34 weeks' gestation) with CD4+ T-lymphocyte counts above 200 cells per cubic millimeter who had not received antiretroviral therapy during the current pregnancy were enrolled. The zidovudine regimen included antepartum zidovudine (100 mg orally five times daily), intrapartum zidovudine (2 mg per kilogram of body weight given intravenously over a one-hour period, then 1 mg per kilogram per hour until delivery), and zidovudine for the newborn (2 mg per kilogram orally every six hours for six weeks). Infants with at least one positive HIV culture of peripheral-blood mononuclear cells were classified as HIV-infected.

Results. From April 1991 through December 20, 1993, the cutoff date for the first interim analysis of efficacy, 477 pregnant women were enrolled; during the study period, 409 gave birth to 415 live-born infants. HIV-infection status was known for 363 births (180 in the zidovudine group and 183 in the placebo group). Thirteen infants in the zidovudine group and 40 in the placebo group were HIV-infected. The proportions infected at 18 months, as estimated by the Kaplan-Meier method, were 8.3 percent (95 percent confidence interval, 3.9 to 12.8 percent) in the zidovudine group and 25.5 percent (95 percent confidence interval, 18.4 to 32.5 percent) in the placebo group. This corresponds to a 67.5 percent (95 percent confidence interval, 40.7 to 82.1 percent) relative reduction in the risk of HIV transmission ($Z = 4.03$, $P = 0.00006$). Minimal short-term toxic effects were observed. The level of hemoglobin at birth in the infants in the zidovudine group was significantly lower than that in the infants in the placebo group. By 12 weeks of age, hemoglobin values in the two groups were similar.

Conclusions. In pregnant women with mildly symptomatic HIV disease and no prior treatment with antiretroviral drugs during the pregnancy, a regimen consisting of zidovudine given ante partum and intra partum to the mother and to the newborn for six

the placebo group. By 12 weeks of age, hemoglobin values in the two groups were similar.

Conclusions. In pregnant women with mildly symptomatic HIV disease and no prior treatment with antiretroviral drugs during the pregnancy, a regimen consisting of zidovudine given ante partum and intra partum to the mother and to the newborn for six weeks reduced the risk of maternal-infant HIV transmission by approximately two thirds.

Abstract: Background and Methods. Maternal-infant transmission is the primary means by which young children become infected with human immunodeficiency virus type 1 (HIV). We conducted a randomized, double-blind, placebo-controlled trial of the efficacy and safety of zidovudine in reducing the risk of maternal-infant HIV transmission. HIV-infected pregnant women (14 to 34 weeks' gestation) with CD4+ T-lymphocyte counts above 200 cells per cubic millimeter who had not received antiretroviral therapy during the current pregnancy were enrolled. The zidovudine regimen included antepartum zidovudine (100 mg orally five times daily), intrapartum zidovudine (2 mg per kilogram of body weight given intravenously over a one-hour period, then 1 mg per kilogram per hour until delivery), and zidovudine for the newborn (2 mg per kilogram orally every six hours for six weeks). Infants with at least one positive HIV culture of peripheral-blood mononuclear cells were classified as HIV-infected.

Results. From April 1991 through December 20, 1993, the cutoff date for the first interim analysis of efficacy, 477 pregnant women were enrolled; during the study period, 409 gave birth to 415 live-born infants. HIV-infection status was known for 363 births (180 in the zidovudine group and 183 in the placebo group). Thirteen infants in the zidovudine group and 40 in the placebo group were HIV-infected. The proportions infected at 18 months, as estimated by the Kaplan-Meier method, were 8.3 percent (95 percent confidence interval, 3.9 to 12.8 percent) in the zidovudine group and 25.5 percent (95 percent confidence interval, 18.4 to 32.5 percent) in the placebo group. This corresponds to a 67.5 percent (95 percent confidence interval, 40.7 to 82.1 percent) relative reduction in the risk of HIV transmission ($Z = 4.03$, $P = 0.00006$). Minimal short-term toxic effects were observed. The level of hemoglobin at birth in the infants in the zidovudine group was significantly lower than that in the infants in the placebo group. By 12 weeks of age, hemoglobin values in the two groups were similar.

Conclusions. In pregnant women with mildly symptomatic HIV disease and no prior treatment with antiretroviral drugs during the pregnancy, a regimen consisting of zidovudine given ante partum and intra partum to the mother and to the newborn for six
